DATA DOCUMENTATION ON THE DEAD AND WINDFALLEN TREES
FOREST PLOT – CAMPAIGNS 2005-2006

Preface

On all forest plots, standing dead trees and windfallen trees with dbh over 7.5cm are selected on a unique 15 m radius circular plot centered on the inventory point. Only the recent dead or windfallen trees (death or fall estimated at maximum 5 years) are taken into account by the national forest inventory.

When the tree mortality is high (over 40 small dead trees in the 15 m radius plot, dispersed equally), rules of simplification are used to measure the small dead trees (D13 ≤ 22.5cm) on a small plot (7.5 m radius plot).

Exhaustive listing of the raw data

Except if mentioned, all the raw data are collected in the field.

IDP: inventory plot ID
A: tree ID
VEGET: vegetation state
ESPAR: tree species
ORI: tree origin
C0: circumference "at the stump" (cm)
V: tree volume (calculated)
W: ponderation coefficient of the tree (calculated)
