DATA DOCUMENTATION ON THE INVENTORY PLOT
FOREST PLOT – CAMPAIGN 2005

Preface

A "forest plot" is an inventory point with forest land cover (except for poplar groves).

The "inventoried" forest plots are the points where all the field measurements have been led; the "not inventoried" forest plots are either points on which the field measurements have been impossible to realize due to accessibility, or points on which the land use is specific and of no interest for the forest inventory. Only the "inventoried" forest plots (over 95% of the forest plots) are diffused.

The determination of the majority of the descriptive variables of the plot (except for ecology) is led on a 20 ares observation plot, centered on the inventory plot (almost a 25m radius circular plot). Otherwise, the size of the plot is clarified.

Exhaustive listing of the raw data

Except if mentioned, all the raw data are collected in the field.

IDP: inventory plot ID
XL93, YL93: geographical coordinates (of the knot)
DEP: county (of the knot)
SER: sylvoecoregion (of the plot)
CSA: land cover
UTA: land use
TM2: forest massif size
DC: type of cut
TPLANT: type of plantation
DIST: skidding distance
ACCES: accessibility
PENTN: logging slope class
PORTN: type of field
ESSPRE: main species (calculated)
CAC: class of age (calculated)
ESS_AGE_1: species on which the age is calculated
